Sm Quarto, PP.265, Weeds As A Biologically Important Class Of Plants

From the PublisherThe first book to deal specifically with weeds as a biologically important class of vegetation. Defines the concept of a weed in biological and ecological terms and concentrates on the crop and weed responses caused by environmental change rather than on the tools used to manipulate vegetation. Develops sections on the potentially positive contributions of weedy vegetation, examines the relative merits of major approaches used to study weed and crop interference, and treats weed-crop competition from resource limitation and physiological viewpoints.
